

Johannes Mogashoa

Software Engineer at Nintex

jomogashoa1993@gmail.com +27677749455

Personal Info

Experience:
4-6 years

Notice period:
4 weeks from beginning of calendar month

Employment type:
Interested in permanent work

Based in:
Kempton Park, South Africa

Workplace policy preferences:

- Remote
- Hybrid · Johannesburg, South Africa, Pretoria, South Africa

Citizenship:

- South Africa

About

Software Engineer with **5 years of experience** specializing in **C#, TypeScript, React, and Node.js**. I focus on building scalable applications and bridging the gap between complex backend logic and intuitive user experiences.

I am driven by efficiency, specializing in architecting tools that solve real-world bottlenecks. Beyond production code, I am a high-signal learner and community contributor—sharing technical insights on Dev.to, contributing to open-source, and building custom CLI utilities to automate and streamline development lifecycles.

Ideal next job

I am looking for a **Remote or Hybrid (Johannesburg)** role within a fast-paced **startup** environment. I thrive in high-ownership teams where I can leverage my **C# and Full-stack TypeScript** expertise to build scalable products from the ground up.

My goal is to contribute to architectural decisions and streamline development workflows while deepening my expertise in **AWS/Azure** cloud infrastructure. I am seeking a collaborative team that values engineering excellence, where I can solve complex problems and deliver high-impact tools that directly drive company growth.

Role preferences

Backend engineer	2-4 years
Frontend engineer	2-4 years
Full stack engineer	2-4 years
Mobile engineer	0-1 years

Skills I want to work with

TypeScript	2-4 years
.NET	2-4 years
React	2-4 years
C#	2-4 years

JavaScript	4-6 years
Vue.js	1-2 years
API Design	2-4 years

Work experience

NI

Software Engineer

Nintex

February 2026 - Present (7 months)

Remote • Full-time

TypeScript · React · Artificial Intelligence · npm · NestJS · React Router · Jest · SCSS · Zustand · Systems thinking · Clear communication · Giving and receiving feedback · Product thinking · Ownership and accountability

Focus: Product Modernization & End-to-End Feature Ownership

- **Spearheading the modernization and expansion** of "Processes," a core Nintex product, through the rebuilding and optimization of legacy modules into high-performance features.
- **Exercise end-to-end ownership** of the full feature lifecycle, driving projects from initial requirement refinement and technical scoping to successful production delivery and stakeholder demonstrations.
- **Optimized the Spec Driven Development (SDD) process**, collaborating with the engineering team to refine technical documentation standards and ensure high-fidelity implementation of business requirements.
- **Drive engineering excellence** within a high-performance team, contributing to architectural discussions and maintaining code quality through rigorous peer reviews and mentorship.
- **Collaborate cross-functionally** to translate complex user needs into scalable technical solutions, ensuring seamless integration within the existing product ecosystem.

Reason for leaving:•Career growth•Learning new technologies and exploring different products

IS

Intermediate Software Developer

InSync Solutions

March 2023 - December 2025 (2 years, 9 months)

Hybrid • Full-time

C# · jQuery · .NET · Microsoft SQL Server · Docker · Azure · API Design · Cosmos DB · Microservices Architecture Design · Blazor · Creative problem-solving · Ownership and accountability · Influencing without authority · Product thinking · Decision-making

Focus: Full-stack Development, Architecture & R&D

- **Led the architectural transition** of a legacy Warehouse Management System (WMS) to a **Microservices architecture** using **.NET 8, Azure Cosmos DB, and MongoDB**.
- **Implemented advanced design patterns** including **DDD (Domain-Driven Design)**, Mediator, Outbox, and Event-driven patterns to ensure system scalability and reliability.
- **Spearheaded R&D for the Innovations Team**, successfully migrating legacy .NET Framework applications to **.NET 7**, establishing the company's modern project boilerplate.
- **Lead Developer** for a high-impact **Progressive Web App (PWA)** using **Blazor and Entra ID**, which streamlined roll-call processes for shift managers.
- **Developed and launched** Version 1 of an Incident Management module and an automated Overtime module, improving internal resource tracking and reporting accuracy.

- **Managed cross-company collaborations**, serving as the lead technical point of contact when integrating with external partner systems (e.g., EPC dealer portal).
- **Containerized core services** using Docker to standardize development environments and simplify cloud deployment.

Reason for leaving:
I wanted a bit more growth on the projects I work on and experience other tools and technologies.

VA

JS Frontend Engineer

Vaimo

July 2022 - February 2023 (7 months)

Hybrid • Full-time

JavaScript | jQuery | PHP | XML | Linux | Docker | React | Less | Magento | GraphQL | Active listening | Cross-functional collaboration | Continuous learning | Initiative and proactivity

I work with e-commerce tools like Adobe Magento, Magento PWA Studio, and VodaPay Mini App to create full-service omnichannel solutions for B2B & B2C brands and deliver the best possible user experience for both the client and the end user of the solution.

- Work on an e-commerce website using Magento PWA Studio, Vodapay Mini App, and Core Magento.
- Implement functionality according to designs
- Make changes to live sites, apply fixes to bugs

Reason for leaving:
I wanted to be able to work on features as a whole, tackle the complete flow and build of the feature not just frontend development. In the world of e-commerce, there were other emerging technologies that I would have loved to play around with, research and development.

CO

Code Reviewer

CoGrammar

May 2022 - July 2022 (2 months)

Remote • Part-time

JavaScript | CSS | Bootstrap | HTML5 | Node.js | Decision-making | Clear communication | Giving and receiving feedback | Mentoring and knowledge sharing | User empathy

Focus: Quality Assurance & Technical Mentorship

- **Conducted technical code reviews** for 50+ students, ensuring adherence to clean code principles, industry standards, and best practices in **JavaScript and Python**.
- **Provided detailed, actionable feedback** on logic, security, and performance, helping students improve their problem-solving approaches and code readability.
- **Identified and debugged complex issues** in student submissions, maintaining high educational standards and ensuring a deep understanding of full-stack concepts.
- **Mentored aspiring developers** on modern development workflows, including version control (Git) and effective documentation.

Reason for leaving:
I was not able to apply myself consistently enough, provide the best service possible whilst having a full time job and studying.

CC

Junior Software Developer

Cybersec Clinique

October 2020 - February 2022 (1 year, 4 months)

Office • Full-time

C# | User Experience Design | User Interface Design | Prototyping | Vue.js | Firebase | ASP.NET MVC | ASP.NET Web API | Entity Framework | ASP.NET Core | Analytical thinking | Creative problem-solving | Stakeholder management | Ownership and accountability | Product thinking

Focus: Full-stack Development & Team Leadership

- **Led the development team** in the delivery of diverse web applications, including ERP systems, gate access control modules, and custom e-commerce platforms.
- **Developed cross-platform solutions** using **C# (.NET Core)** for backend services and a variety of frontend frameworks including **React, Vue.js, and Angular**.
- **Architected mobile applications** using **React Native**, ensuring seamless performance across iOS and Android devices.
- **Owned the UI/UX lifecycle**, utilizing **Adobe XD** to create high-fidelity prototypes and design systems for client presentations and approvals.
- **Authored comprehensive technical documentation**, including ERDs, Software Requirement Specifications (SRS), and user manuals to ensure smooth project handovers.
- **Mentored and onboarded new interns**, fostering a collaborative learning environment and upholding code quality standards.
- **Recognized as Employee of the Month (Feb 2021)** for exceptional performance and dedication to project delivery.

Reason for leaving:
I had to relocate back to campus to complete my studies and unfortunately couldn't work remotely.

Projects

Aluna Studio

Feb 2026 - Present

Uses AI in workflows

Designed and built Aluna Studio's production e-commerce platform end to end using Next.js, React, TypeScript, Tailwind, Sanity and PostgreSQL. Implemented catalogue and product pages, persistent cart, multi-step checkout, payments, order management, inventory validation, transactional email and observability. Owned the full lifecycle from architecture and third-party integrations through production hardening and release.

Problem

Aluna Studio needed more than a storefront: it required a reliable commerce workflow where product availability, payments, orders and customer communication remained consistent even when external payment events failed, were delayed or were delivered more than once. The challenge was keeping the customer experience simple while making transaction processing resilient, traceable and safe.

Impact

Delivered an end-to-end online sales channel with automated checkout and order processing. Implemented stock validation, signed webhook verification, replay protection, deduplicated asynchronous processing and payment reconciliation to protect order state from missed or duplicate events. Added automated customer/admin notifications and structured Sentry-backed observability to improve production reliability.

How I used AI

AI-assisted development: Used AI tools to accelerate architecture exploration, implementation and code review across the project. AI was particularly useful for challenging assumptions and identifying edge cases around payment processing, webhook reliability and production failure scenarios. All architectural decisions, integrations, validation and production hardening remained under my ownership.

---

HouseKeeper — Cloud-Native Household Management Platform

Uses AI in workflows

Designed and implemented the foundation of a mobile-first household management platform using .NET 10, ASP.NET Core, Blazor WebAssembly and PostgreSQL. Built the backend as a modular monolith with module-owned data boundaries, explicit authorization and migrations. Added multi-layer automated testing, Docker-based local development and AWS infrastructure-as-code using CDK, ECS Fargate, RDS, Cognito, S3 and CloudFront.

Problem

I wanted to solve the fragmentation of household tasks and information while designing a system that could grow without accumulating unnecessary architectural complexity. The challenge was creating a mobile-first product with clear business boundaries, reliable persistence, strong authorization and a credible path from local development to AWS production without prematurely adopting microservices.

Impact

Established an end-to-end vertical slice from Blazor PWA through ASP.NET Core authorization and EF Core to PostgreSQL, including persistence across application restarts. Introduced domain, component, architecture and Playwright end-to-end testing, migration-backed CI and enforceable module boundaries. Designed an immutable-artifact AWS deployment pipeline with protected promotion, OIDC-based access and isolated database migrations.

How I used AI

Used AI-assisted development as part of the engineering workflow for architecture exploration, implementation, test generation and pull-request review. AI acted as an additional engineering review layer for challenging design decisions and identifying edge cases, while architectural decisions, implementation validation and release approval remained explicitly controlled and reviewable.

Ascendia — AI-Powered Personal Finance & Transaction Analysis Platform

Uses AI in workflows Ships AI features

Built an AI-powered personal finance application integrating directly with the Investec banking API. Authenticated users can securely connect their accounts, retrieve balances and transaction history, and analyse real banking transactions using LLMs through OpenRouter.

Built the platform with Next.js, TypeScript, tRPC, Prisma and PostgreSQL, with server-side financial integrations and persistent AI analysis history.

Problem

Banking applications expose transactions but often leave users to interpret their financial behaviour themselves. I wanted to explore how AI could turn raw transaction history into understandable financial insights while maintaining clear security boundaries around banking credentials and sensitive integrations.

Impact

Implemented an end-to-end financial analysis workflow from authenticated Investec account connectivity through transaction retrieval to AI-generated spending insights. Integrated OpenRouter as a model gateway, allowing transaction data to be analysed for spending categories, trends, unusual activity and savings opportunities, with generated analyses persisted for later review.

How I used AI

Integrated OpenRouter into the application as an AI model gateway for transaction analysis. Real Investec transaction data is prepared server-side and submitted to an LLM with a financial-analysis prompt designed to categorise spending, identify patterns and anomalies, and produce actionable recommendations in a South African financial context. The integration uses the OpenAI SDK against OpenRouter's API, keeping model access server-side and allowing the underlying model to be changed independently of the application workflow.

TypeScript · PostgreSQL · React · Artificial Intelligence · RESTful API Design · Next.js · OAuth · Prisma · Prompt Engineering · tRPC

AI fluency

How I use AI

I use AI in my workflows

I use AI throughout my engineering workflow: exploring architecture and trade-offs, debugging, generating test cases, reviewing pull requests, improving documentation and breaking work into implementation tasks. I also use agents such as Codex as an additional review layer to challenge assumptions and surface edge cases. AI speeds up delivery, but I still own the design decisions, verify generated code, run tests and decide what reaches production.

I ship AI features

I've shipped AI features in fintech and content-processing projects. In Ascendia, I integrated OpenRouter to analyse real Investec transactions for categories, trends, unusual spending and savings opportunities. I keep model calls server-side and use constrained prompts, validation and clear error handling. In an AI podcast app, I orchestrated transcription plus parallel generation jobs with retries and partial-failure handling to improve reliability and latency.

Work experience: Nintex | Software Engineer

Projects: HouseKeeper — Cloud-Native Household Management Platform • Ascendia — AI-Powered Personal Finance & Transaction Analysis Platform • Aluna Studio

How I apply extra judgement or caution when using AI

I apply extra caution when AI touches financial or sensitive data. I keep credentials and privileged integrations server-side, minimise the data sent to models, and avoid exposing secrets or unnecessary personal information. I also treat AI output as advisory rather than factual truth: financial calculations and important business rules should be deterministic and validated in code. I pay particular attention to hallucinations, prompt injection, latency, model cost and failure handling.

Education and training

Formal education
